Session 1: What is Programming?

What you will learn?

- In this project, we are going to see how traffic lights work?

Introduction to Computers and Programming

- **Computers**

- Electronic devices that can perform a variety of tasks by following a set of instructions.

Introduction to Computers and Programming

- **Hardware**

- The physical components of a computer (e.g., CPU, memory, storage devices)
-

Introduction to Computers and Programming

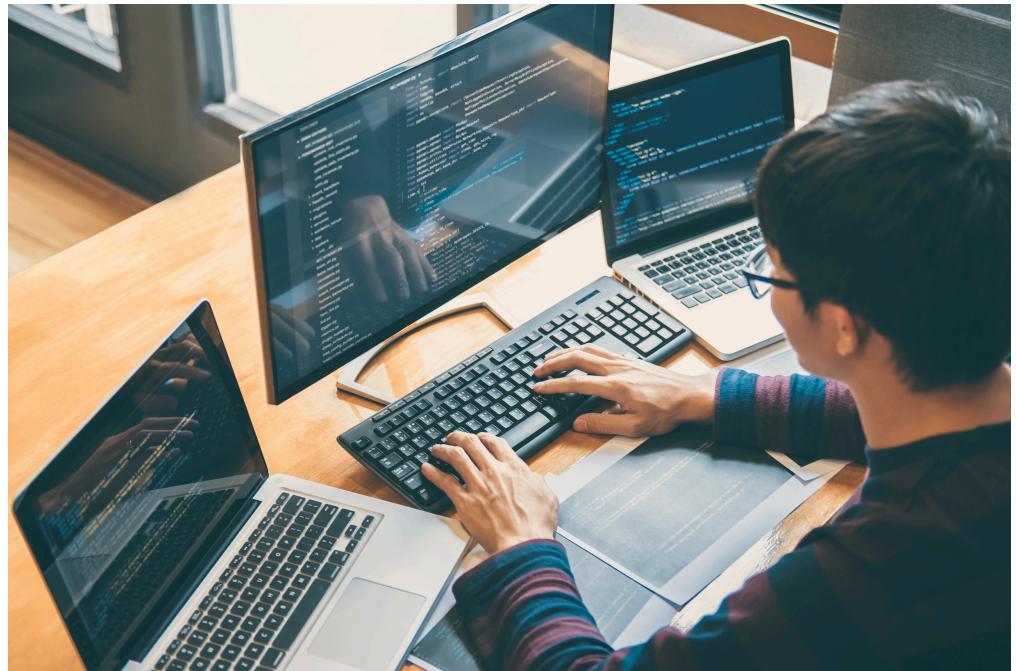

- **Software**
 - Programs and operating systems that run on the hardware, enabling it to perform tasks.

Introduction to Computers and Programming

- **Programming**

- The process of creating software by writing code. A programmer writes instructions in a programming language to solve problems or perform tasks

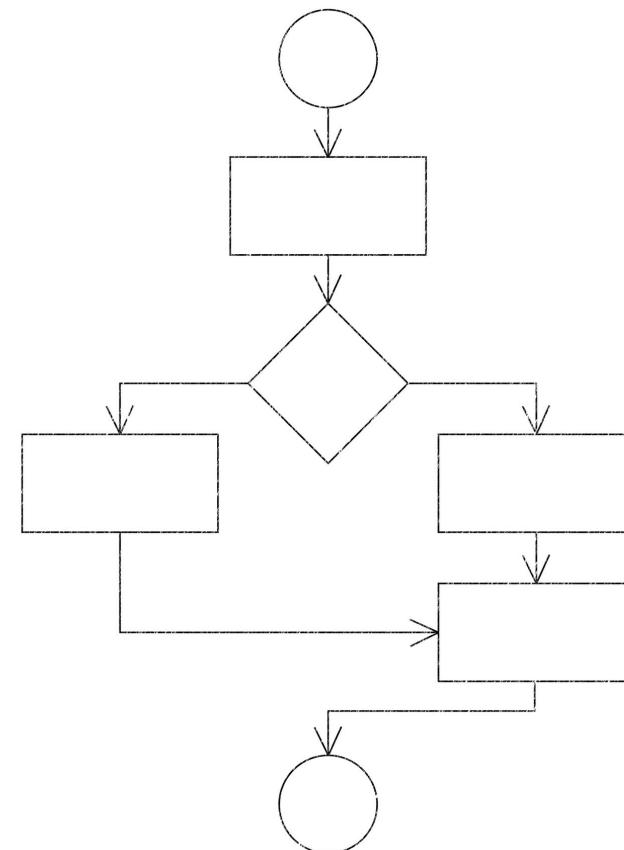

Basic Concepts of Programming

- **Algorithm**
 - A step-by-step procedure or formula for solving a problem. It's a plan for solving a problem using a sequence of instructions
- **Example**
 - Recipe for baking a cake. Each step needs to be followed in a specific order to achieve the desired result
-

Basic Concepts of Programming

- **Flowchart**
 - A diagram that represents an algorithm. It uses symbols to show the flow of steps involved in solving a problem
- **Symbols**
 - **Oval:** Start/End
 - **Rectangle:** Process/Instruction
 - **Diamond:** Decision/Conditional
 - Arrows: Flow of control

Programming Languages

- **What is a Programming Language?**
 - A programming language is a formal language comprising a set of instructions that produce various kinds of output.
 - Used by programmers to communicate with computers and create software.
 -

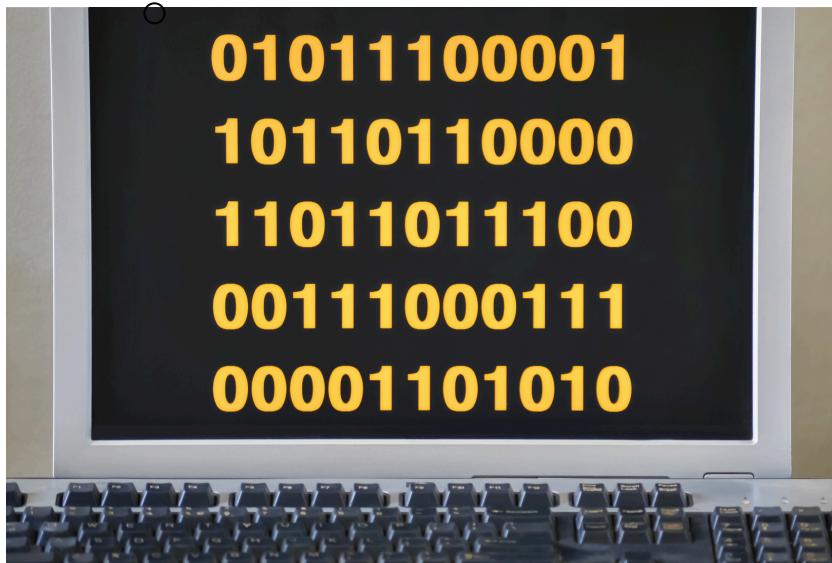

A screenshot of a code editor displaying a C program. The code is used to generate random graphs and calculate their complements. It includes functions for clearing the screen, printing headers, entering vertex counts, generating matrices, displaying matrices, and calculating complements. The code is annotated with line numbers from 1 to 33.

```
complement(int D)

void main(void)
{
    int A[max][max], B[max][m
    system("clear");
    printf("\n\tRandom Graph g
    printf("\n\tEnter number of
    scanf("%d", &vertex);
    generation(A, &vertex);
    printf("\n\tGenerated Ran
    display(A, &vertex);
    printf("\n\tComplement
    complement(A, B, &ve
    display(B, &vertex);
    printf("\n\tComplement o
}
```

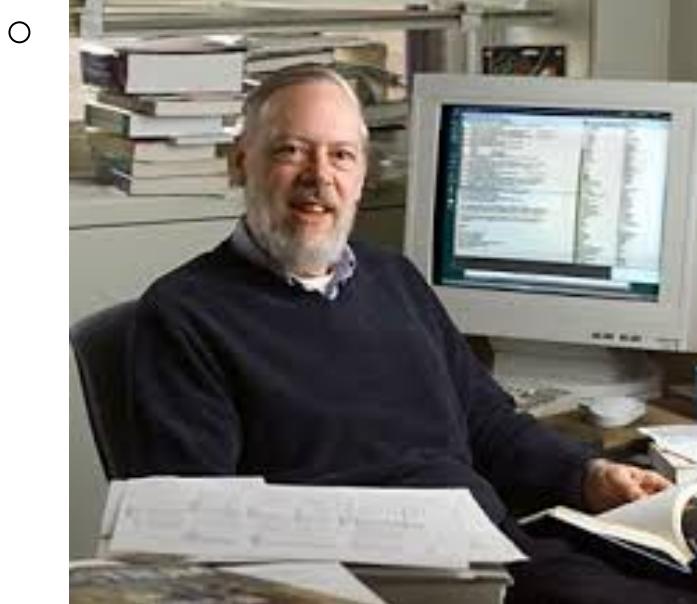

Programming Languages

- Types of Programming Languages
 - **Low-Level Languages:** Close to machine code. Examples: Assembly language.
 - **High-Level Languages:** Easier for humans to understand and write. Examples: Python, Java, C.

Introduction to C Programming

- **History:**
 - Developed in the early 1970s by Dennis Ritchie at Bell Labs.
- **Importance:**
 - Foundation for many other programming languages. Used in systems programming, game development, and embedded systems.

The Role of C Programming

- **Applications of C**

- System software (e.g., operating systems, compilers).
- Embedded systems (e.g., microcontrollers, automotive systems).
- Game development.
- Application software.

The Role of C Programming

- **Why Learn C?**

- Provides a strong foundation in programming concepts.
- Helps understand how computers work at a low level.
- Influences many modern languages (e.g., C++, Java, Python).
-

Basic Programming Concepts

- **Variables:**

- Storage locations in a program with a specific type and value. Example: int age = 10;

-

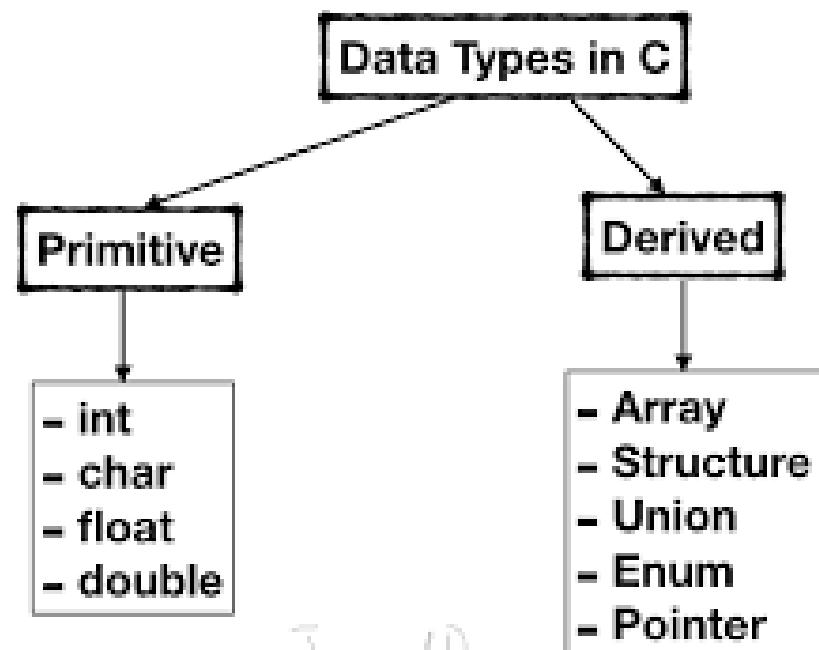

Basic Programming Concepts

- **Data Types:**

- Types of data that can be stored in variables.

Examples: int (integer), char (character), float (floating-point number).

-

Basic Programming Concepts

- **Operators:**

- Symbols that perform operations on variables and values. Examples: + (addition), - (subtraction), * (multiplication), / (division).

The diagram illustrates the classification of C operators into three main types: Unary operator, Binary operator, and Ternary operator. A green rounded rectangle contains a table titled "Operators in C". The table has two columns: "Operator" and "Type". The "Unary operator" row contains the symbols !, *, -, ~, &, ^, /, %, <, <=, >, >=, ==, !=. The "Binary operator" row contains the symbols &&, ||, |, &, |, <<, >>, ==, !=, =, +=, -=, *=, /=, %=, ?:;. The "Ternary operator" row contains the symbol ?:.

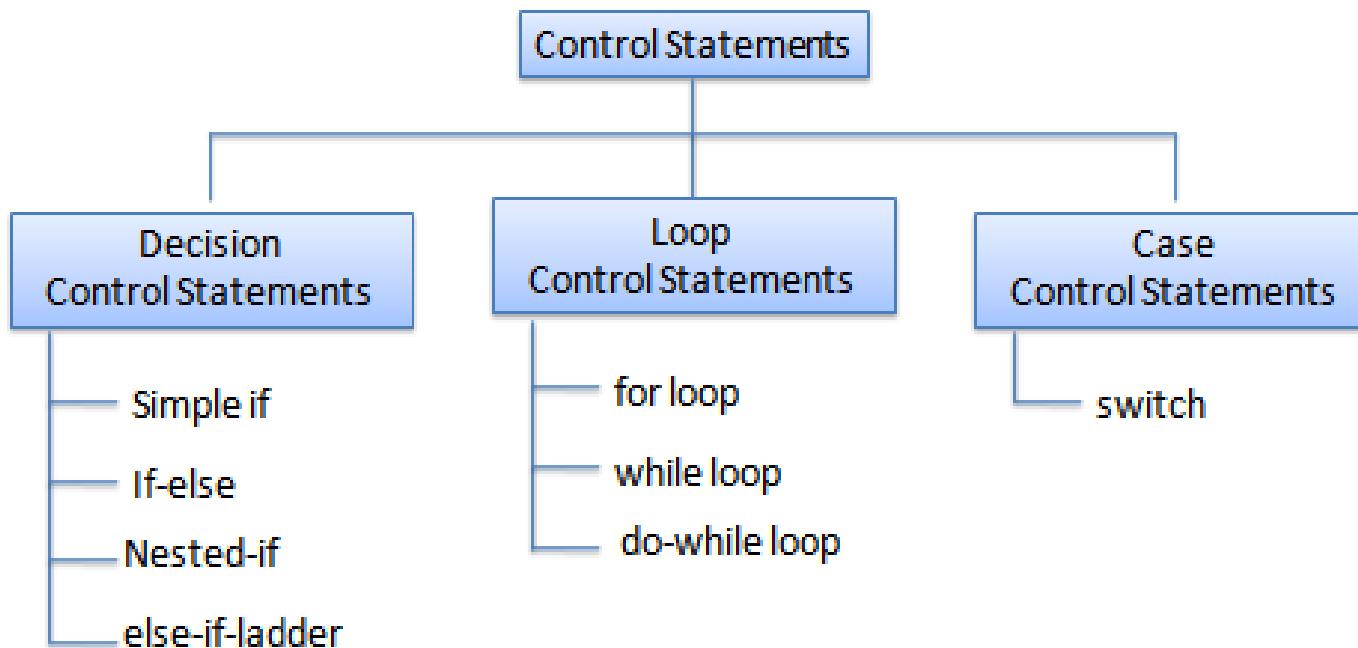

Operator	Type
! , * , - , ~ , & , ^ , / , % , < , <= , > , >= , == , !=	Unary operator
&& , , , & , , << , >> , == , !=	Binary operator
= , += , -= , *= , /= , %= , ?:;	Ternary operator

Basic Programming Concepts

- **Control Structures:**

- Direct the flow of the program. Examples: if statements, loops (for, while).

-

Writing and Running Programs

- **Source Code:**

- The human-readable code written by the programmer.

```
<div><img alt="Logo" ...>
<div class="form-box login-box active">
  <form class="form-signin">
    <input type="text" name="username" placeholder="Email address" value="{{username}}"/>
    <input type="password" name="password" placeholder="Password" value="{{password}}"/>
    <input type="checkbox" id="login-remember"/>
    <label for="login-remember">Keep me signed in</label>
    <button class="btn-tall btn-wide">Log In</button>
  </form>
  {{#error}}
    <p class="error-message">{{error}}</p>
  {{/error}}
</div>
```

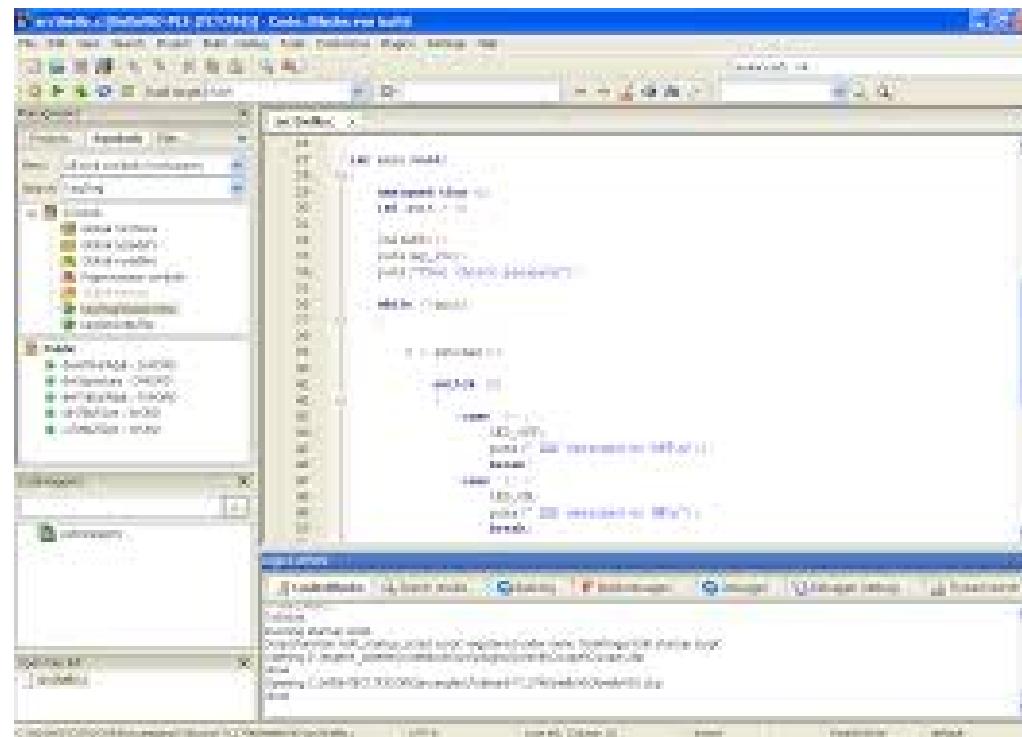

Writing and Running Programs

- **Compiler:**
 - A tool that converts source code into machine code that the computer can execute.
-

Writing and Running Programs

- **IDE (Integrated Development Environment):**
 - Software that provides comprehensive facilities to programmers for software development. Examples: Code::Blocks, Dev-C++.

Basic Program Structure

- **Headers:**
 - Include necessary libraries. Example: #include <stdio.h>
- **Main Function:**
 - Entry point of a C program. Example: int main() { ... }
- **Statements:**
 - Instructions within the main function. Example: printf("Hello, World!");

Basic Program Structure

- **Headers:**
 - Include necessary libraries. Example: #include <stdio.h>
- **Main Function:**
 - Entry point of a C program. Example: int main() { ... }
- **Statements:**
 - Instructions within the main function. Example: printf("Hello, World!");

Example of a Simple C Program

```
#include <stdio.h>

int main() {
    printf("Hello, World!\n");
    return 0;
}
```

Explanation

- **#include <stdio.h>:**
 - Includes the standard input-output library.
- **int main() { ... }:**
 - Main function where the program execution begins.
- **printf("Hello, World!\n");**
 - Prints "Hello, World!" to the screen.
- **return 0;:**
 - Indicates that the program ended successfully.
-

Learning Programming

- **Practice:**
 - Regular coding practice helps improve programming skills.
- **Problem-Solving:**
 - Programming enhances problem-solving abilities by breaking down complex problems into smaller, manageable tasks.
- **Creativity:**
 - Programming allows for creative solutions and building projects from scratch.
- **Persistence:**
 - Debugging and troubleshooting are essential parts of the learning process.
